

Intact iQ: Module

# MWS

**Elevate Your Business  
With Intact iQ MWS.  
Mobility in the warehouse  
can dramatically improve  
your productivity, resource  
utilisation, and inventory  
management.**

## The Move to Smarter Warehousing

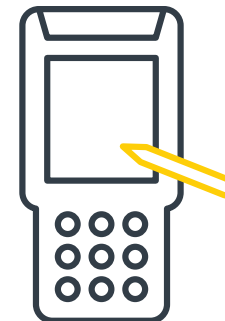

The Intact iQ Mobile Warehouse Solution is a cost effective means of providing 'anywhere, anytime' flexibility that allows you to embrace the advances in modern handheld technology.

It will enable you to automate and simplify previously labour intensive warehouse tasks saving time and money, improving stock accuracy, reducing overstocking and shrinkage.

It will also allow you to track items from goods in to goods out, automatically update stock records in real-time, minimise picking times and picking errors, assign barcodes to products and carry out rolling stock takes.

The application software for the Intact iQ Mobile Warehouse Solution is run on the host system and simply acts as an extension of your Intact iQ system, operating on a handheld device. The handheld devices appear to it like a wireless keyboard/display/scanner. This eliminates the need to program the individual handsets so multiple units can be added to the system seamlessly. The big benefit of this is that communication is in real-time.

In addition, the Intact iQ MWS module is highly configurable. The function features highlighted in this brochure can be expanded upon to accommodate many of the features in your Intact iQ system.

# Customers today are increasingly in a position to demand accuracy, timeliness, and zero damage for every order.

Warehouse managers are therefore investing in cost-effective processes and technologies that improve accuracy and thus customer satisfaction.

The Intact iQ Mobile Warehouse Management solution meets this need by offering fully integrated, handheld mobile technology that provides secure, real-time stock information for your warehouse team.

## Real-Time Data

The Mobile Warehouse Solution operates a live connection to your Intact iQ system ensuring your warehouse team have access to real-time order status information. Your management team will also have insight into the exact status of orders and inventory; this is particularly important where delivery lead times must be met and any lag in order dispatch can provide management with the warning they need to take action.

## Increase Productivity

Your Mobile Warehouse Solution will allow your warehouse team to move from one order to the next without the need to return to a workstation to enter data—their mobile handhelds will automatically enter the data for them!

## Effective Stock Management

Rolling stock takes enable businesses to regularly check stock levels, helping to identify discrepancies early on. Handheld device technology allows you to quickly and accurately record stock in this fashion. Many of our customers run partial stock takes on an ongoing basis to help reduce stock variance levels. Additionally, should you wish to perform standard stock takes, partial and/or ad-hoc stock takes and ABC stock counting the Intact iQ MWS module can accommodate your stock management preferences.

## Easy to Use, Configurable Interface

The 'Point and Scan' nature of handheld scanners ensures the system is extremely easy to use requiring very little, if any, training for your warehouse team. In addition, the interface is configured to display only those fields required by the user.

## Reduce Human Error

The use of handhelds reduces human error as stock locations are clearly set out on the handheld device. Your warehouse team can pick, pack and ship goods without having to complete paperwork or input data.

## Speed up the Booking in Process

Your staff can book in stock from anywhere on your site, making recording of stock, pallets, batches etc. convenient and fast.

## Speed up the Stocktaking Process

Stock adjustments, counts etc. can be entered at the bin location using the handheld device making the process less labor intensive.

## Remote Site Access

If your business has remote sites with Wi-Fi network access (e.g., one main dispatch facility and multiple storage sites) you can implement Intact iQ MWS at the remote sites and control the movement of stock between the remote sites and your main site, whilst remaining informed and in control of stock availability.

# Stock Function Features

## Stock Enquiry

---

Scan the barcode to display price, stock quantity, cost, supplier etc.

## Stock Bin Assignment

---

Assign products to specific stock bin locations in your warehouse. Then when products enter the warehouse the assigned stock location is automatically displayed on the handheld when scanned on goods-in.

## Barcode Assignment

---

Assign inner and/or outer barcodes to stock as it enters your warehouse.

## Stock Transfers

---

Facilitate quick movement of stock from one bin location to another.

## Product Label Requisition

---

The warehouse team can print labels immediately via a remote printer or simply put into the queue for your label printer.

## Stock Take

---

Access stock quantity data from the system and record actual stock levels using your handheld devices. Carry out rolling stock takes with the partial stock take feature.

## Stock Adjustment

---

Adjust stock levels on the warehouse floor and sync back to your main Intact iQ system.

## Put Away Functions

---

Goods can be entered into a goods In holding location on delivery.

# Sales Function Features

## Sales Packing

---

Either as part of picking, or as a separate process, picked goods can be packaged and labelled, with the operator detailing which package types are used and what is in each.

## Sales Delivery Note Generation

---

Although the order picking process can be configured to automatically generate sales delivery notes on completion, delivery notes can also be created directly on the handheld device.

## Order Picking

---

Order picking notes pushed out to the warehouse team via handhelds

# Purchase Function Features

## Purchase Returns Notes

Purchase returns notes can be created directly on the handheld device when goods are required to be returned to suppliers. This ensures the operator doesn't have to return to the back office to enter the details.

## Goods Received

Create a goods in purchase delivery note at the point of entry.

## Purchase Requisition

The warehouse team can place purchase requisitions, while at the physical stock bin. Purchasing can then bundle these requisitions together based on the supplier.

---

Use the power of Intact iQ MWS to manage your warehouse in real-time to dramatically improve your productivity, resource utilisation, and inventory management.
